

Group 76 Progress Report:

Elite Lu, Ishpreet Nagi, Kenneth Ong
{lue13,nagii,salimk4}@mcmaster.ca

1 Introduction

Healthcare providers deal with many vision related illnesses such as DME (Diabetic Macular Edema), CNV (Choroidal Neovascularization), and drusen that impair vision. They utilize retinal scans to detect and determine the conditions. An issue that arises is the uniqueness of each ailment, as each condition varies in subtle ways. Correctly identifying retinal diseases can prove to be a challenge in a plethora of cases and with approximately 30 million OCT scans performed each year, this process can prove time-consuming for healthcare professionals. By having a classification model that can help speed up this process, we can allow healthcare professionals to focus their attention on helping more individuals requiring their aid.

2 Related Work

Here, talk about the related work you encountered for your approach. Cite at least 5 references. Refer to item 2. No one has done exactly your task? Write about the most similar thing you can find. This should be around 0.25-0.5 pages.

3 Dataset

You should write about your dataset here, following the guidelines regarding item 1. This section may be 0.5-1 pages. Depending on your specific dataset, you may want to include subsections for the preprocessing, annotation, etc.

3.1 Folder Structure

3.2 Preprocessing

Upon loading the images, each image was labeled with an integer to represent its corresponding disease. The images were already named as DISEASE-#####-.jpeg and binned in the correct folders, which allowed for ease of labeling. The numbers for their corresponding disease is shown below:

CNV	0
DME	1
DRUSEN	2
CNV	3

Adding onto this, we transformed the data by randomly flipping them horizontally. This allowed for the training set to have a more robust and diverse dataset. This is technically not considered an augmentation since we did not create new data.

4 Features

Describe any features you used for your model, or how your data was input to your model. Are you doing feature engineering or feature selection? Are you learning embeddings? Is it all part of one neural network? Refer to item 2. This may range from 0.25 pages to 0.5 pages.

5 Implementation

Describe your model and implementation here. Refer to item 4. This may take around a page.

Figure 1: A figure with a caption that runs for more than one line. Example image is usually available through the mwe package without even mentioning it in the preamble.

6 Results and Evaluation

How are you evaluating your model? What results do you have so far? What are your baselines? Refer to item 5. This may take around 0.5 pages.

7 Feedback and Plans

Write about your plans for the remainder of the project. This should include a discussion of the feedback you received from your TA, and how you plan to improve your approach. Reflect on your implementation and areas for improvement. Refer to item 6. This may be around 0.5 pages.

8 Template Notes

You can remove this section or comment it out, as it only contains instructions for how to use this template. You may use subsections in your document as you find appropriate.

8.1 Tables and figures

See Table 1 for an example of a table and its caption. See Figure 1 for an example of a figure and its caption.

8.2 Citations

Table 1 shows the syntax supported by the style files. We encourage you to use the natbib styles. You can use the command `\cite{t}` (cite in text) to get “author (year)” citations, like this citation to a paper by ?. You can use the command `\citep{t}` (cite in parentheses) to get “(author, year)” citations (?). You can use the command `\citealp{t}` (alternative cite without parentheses) to get “author, year” citations, which is useful for using citations within parentheses (e.g. ?).

8.3 References

Many websites where you can find academic papers also allow you to export a bib file for citation or bib formatted entry. Copy this into the custom.bib and you will be able to cite the paper in the $\text{\LaTeX}$. You can remove the example entries.

8.4 Equations

An example equation is shown below:

$$A = \pi r^2 \tag{1}$$

Labels for equation numbers, sections, subsections, figures and tables are all defined with the `\label{label}` command and cross references to them are made with the `\ref{label}` command. This an example cross-reference to Equation 1. You can also write equations inline, like this: $A = \pi r^2$.

Team Contributions

Write in this section a few sentences describing the contributions of each team member. What did each member work on? Refer to item 7.

Figure 2: A minimal working example to demonstrate how to place two images side-by-side.

Output	natbib command	ACL only command
(?)	\citep	
?	\citealp	
?	\citet	
(?)	\citeyearpar	
?’s (?)		\citeposs

Table 1: Citation commands supported by the style file.
